Generative AI Engineer- STL, Pune

Dear Hiring Team,

I am applying for the Generative AI Engineer role in Pune. I have 3 years of professional software development, and I now build LLM agents and RAG systems; I can start immediately and I live in Pune.

You ask for practical agentic AI work and RAG. My multi-agent-research-crew (github.com/huss2003/multi-agent-research-crew) runs a planner, parallel researchers, a writer and a verifier on a custom Python asyncio DAG with Claude, adding retries, timeouts, token budgets and claim-level citation checks. site-to-agent (github.com/huss2003/site-to-agent) combines hybrid BM25 and pgvector retrieval with RRF, cited answers and an eval harness. For production APIs and serving, nanoserve (github.com/huss2003/nanoserve) is an LLM inference engine with a FastAPI streaming API and 3.1x throughput over sequential decoding. At a US-based medical-device company I built internal AI agents and a CRM as a Full Stack Developer.

I should be plain about gaps: I have built my own orchestration instead of using LangChain or LangGraph, my evals are custom, and I have not yet run workloads on AWS, Azure or GCP. I pick up tools quickly and can port a project to LangGraph if useful. My CV is attached; could you also confirm the experience level and pay range for this role?

Kind regards,

Hussain Singapuri
